Vitis rotundifolia

• **Muscadinia**
  – *V. rotundifolia*
  – *V. musoniana*
  – *V. popenoi*
  – 40 chromosomes

• **Euvitis**
  – *V. vinifera* – wine grapes
  – *V. labrusca* – concord grapes
  – 38 chromosomes
Native Muscadines

- Found growing wild throughout the Southeast.
- Excellent regional adaptation.
- Muscadine was the first domesticated American grape.
First Cultivars - Wild selections

Female vines
- 'Scuppernong'
- 'Thomas'
- 'Flowers'
- 'Mish'
- 'James'
- 'Memory'

Male vines
- 'White Male #1'
- 'Black Male'

'Scuppernong' was the dominant cultivar from 1750-1947. Several different 'Scuppernong' cultivars likely exist.
First era: 1909-1938

H.P. Stuckey and J.G. Woodroof

- 3 female vines and 2 male vines used as parents.

- 13 cultivars released (1917-1938).

- 'Hunt', 'Dulcet', 'Yuga', 'Creek' most important cultivars.

- Selected for yield, sweet tender pulp, and non-shattering berries. Often cluster picked.
History of the UGA muscadine program

Second era: 1951-1968

B.O. Fry

'Fry', 'Cowart', 'Higgins', 'Jumbo'

- Selected for large size, bronze color, high soluble solids.

- 'Higgins' created – source of large size in most muscadine cultivars.

- Lower vine vigor and increased susceptibility to fruit rots.

'Higgins' - 1955
'Fry' muscadine

'Fry' most important fresh use cultivar developed, 9.3 g / berry.

Bronze
Large Size
High soluble solids
Good green flavor

Fruit rot susceptible
Female

'Fry' - 1971
Perfect flowered cultivars developed.

'Mcowart', first perfect flowered cultivar with good fruit quality released.
History of the UGA muscadine program

Third era: 1969-1996

R.P. Lane

- Wanted large size of 'Fry' combined with perfect flowers.
- 'Triumph' – bronze perfect flowered.
- 'Summitt' – female with higher productivity than 'Fry'.
- 'Tara' – large size with perfect flowers.
- 'Scarlett' – new pink color.
- 'Golden Isles' – juice grape with less pronounced muscadine taste.

Most of these cultivars feature 'Fry' heavily in their pedigree.
Creating the perfect muscadine.
Muscadine Breeding Techniques
Muscadine seedlings have vigorous growth.
Flowering begins in 2nd year.

Turnover seedling vineyard in 3-4 years.
• Yield trials take place on UGA farms and with a local grower.
• Observational trials take place at several grower vineyards and at cooperative universities.
1. Good flavor: flesh and skin.

Ideally will have good flavor even when picked before fully ripe. Skin should break up when chewed and lack bitter and sour flavors.
2. Self-fertile flowers

Yield of female vines reduced due to “cap-stick”, smaller cluster size, lack of pollination.
Current Goals of the Program

- Very large berry size with perfect flowers.
  - Need to replace all female cultivars.

Avg. % full crop 2004-2008

- Pistillate cultivars
  - Fry – 70
  - Supreme – 90
  - Sweet Jenny – 50
  - Pam – 60
  - Scarlett – 30
  - Darlene - 40

- Self-fertile cultivars
  - Alachua - 100
  - Cowart – 90
  - Nesbitt – 100
  - Pollyanna – 80
  - Tara – 90
  - Triumph - 100
3. Large berry size

- Self-fertile cultivars are usually smaller than female cultivars, but more consistent in size.
- Minimum = 10-11 grams, 1 inch diameter

'Supreme' 14.7 g  
Ga. 5-1-38 13.9 g
4. Dry stem scars and firm flesh. Torn and split berries are often juiced rather than packed. Often juice up to 1/3 of cultivars with wet scars.
Desirable Traits for a New Muscadine Cultivar

5. Vigorous, disease resistant vines.
   Much easier in purple varieties.
Short-range goals of the program

• Very large berry size with perfect flowers.
  – Bronze and black color.
  – Early, mid, and late-season harvest.
  – Two cultivars for each category.

</tr>
</thead>
<tbody>
<tr>
<td>Weight</td>
<td>13.9g</td>
<td>15.0g</td>
<td>14.7g</td>
</tr>
</tbody>
</table>
Short-range goals of the program

• Red berry color.
  – Flavor also seems to vary.
  – Requires shelf space in market.

HPLC analysis
Low total anthocyanins (400 ug/g)
High % Cyanidin (60%)  
Low % Delphinidin (20%)
Mid-range goals of the program

- Improved fruit texture
  - Firm crisp flesh.
  - Friable skin.
Long-range goals of the program

*Euvitis* × *Muscadinia* hybrids

– Expanding the germplasm

Possible traits from *Euvitis*

– Seedless berries
– Stable juice color
– Pigmented flesh
– Improved berry flesh
– New flavors
– Larger clusters
Where we are now.

- Crosses between bridge hybrids and several seedless *Euvitis* clones starting in 2011.
- We have flowering and self-fertile flowers, potential seedless selections being crossed to female muscadines next year.
‘Lane’ and ‘Hall’ are harvestable last week of July in Tifton, at the beginning of the harvest season.

‘Lane’ and ‘Hall’ have similar size to other self-fertile cultivars and ‘Lane’ has particularly good sugar content.

</table>
‘Lane’ muscadine

‘Lane’ has moderate yields and can split at the stem scar. We currently recommend planting ‘Lane’ for early season black production and transitioning into ‘Supreme’ for main season black production.
‘Hall’ muscadine

‘Hall’ has good yields with very low stem scar split and tear. ‘Hall’ berries are similar to ‘Tara’ with a better flavor and higher brix.
‘Hall’ muscadine

‘Hall’ is more yellow in color than many other bronze cultivars. ‘Hall’ should be sprayed and picked promptly to minimize ripe rot infection. ‘Hall’ is recommended as a replacement for ‘Tara’ and as an early season, self-fertile bronze cultivar.
Coming Attractions : Ga 6-2-26

- Self-fertile flowers with a size similar to female cultivars.
- Main-season self-fertile replacement for ‘Supreme’.
- Excellent storage ability.
- Excellent picking scar.
